...BladeRunner protection on bottom.

BladeRunner™ Edge Protection

BladeRunner polyethylene edge protection enhances load stability and improves brick alignment. Its ability to stretch under application reduces the slack between straps, providing for greater cube stability in rough handling situations.

✓ Increased initial retained tension

When BladeRunner is applied to all four corners of a brick cube, the initial retained tension is 11 percent higher than that of non-woven polyester. As a result, BladeRunner keeps cubes together, minimizing downtime throughout the distribution process.

✓ Higher UV protection

With UV protection built-in, BladeRunner is designed to withstand outdoor weather conditions during shipping and storage. In an accelerated weathering test comparing BladeRunner and non-woven polyester, BladeRunner showed no breakdown in material strength after over one year of testing, whereas some competitive materials lost over 65% of their strength in as little as 90 days.

✓ Flawless tracking

BladeRunner's unique design with horizontal ribbing allows it to fold evenly over the corners of a brick cube, providing improved tracking on uneven surfaces. This coupled with consistent thickness, width and footage per roll provides greater efficiency and accuracy during application versus competitive products.

✓ Company recognition

BladeRunner can be custom printed with your company name or logo helping to identify brick loads and their origin. Unlike other substrates, BladeRunner is specially treated prior to printing allowing for the ink to adhere better, reducing the instances of scuffing and peeling during handling.

Brick cubes settle each time they are handled, resulting in an overall reduction in package perimeter. When using polyester strap, there is an elongation recovery in the strap, but the initial applied strap tension cannot be regained. BladeRunner™ Edge Protection can increase the initial applied tension transmission around the brick cube allowing for better strap elongation recovery, maximizing strap tension and cube integrity throughout the distribution cycle, resulting in better arrival condition.
